PROBLEM 1.

Suppose  $X_1, \dots, X_n \stackrel{iid}{\sim} \Gamma(\alpha, \lambda)$ , where  $\alpha$  is known and  $\lambda > 0$ . Prove that  $\bar{X}/\alpha$  is the best unbiased estimator of  $1/\lambda$ .

SOLUTION.

The joint pdf of the sample is

$$\begin{aligned} f(X|\alpha, \lambda) &= \prod_{i=1}^n \frac{\lambda^\alpha x_i^{\alpha-1} e^{-\lambda x_i}}{\Gamma(\alpha)} \\ &= \frac{\lambda^{n\alpha}}{\Gamma(\alpha)^n} \left( \prod_{i=1}^n x_i \right)^{\alpha-1} e^{-\lambda(\sum x_i)}, \end{aligned}$$

which means the joint pdf belongs to the exponential family, and has an open set in the natural parameter space. Hence,  $T = \sum x_i$  is complete sufficient statistics. Since  $\bar{X}/\alpha = g(T)$  and  $\mathbb{E}(g(T)) = 1/\lambda$ , by the Lehmann-Scheff Theorem, we can conclude that  $\bar{X}/\alpha$  is the best unbiased estimator of  $1/\lambda$ .

PROBLEM 2.

Suppose  $X_1, \dots, X_n \stackrel{iid}{\sim} \mathcal{N}(0, \sigma^2)$ .

- (a) Find the UMVUE of  $\sigma$ .
- (b) Find the UMVUE of  $\sigma^4$ .

SOLUTION.

The joint pdf of the sample is

$$\begin{aligned} f(X|\sigma^2) &= \prod_{i=1}^n \frac{1}{\sqrt{2\pi\sigma^2}} e^{-x_i^2/(2\sigma^2)} \\ &= (2\pi\sigma^2)^{-\frac{n}{2}} e^{-(\sum x_i^2)/(2\sigma^2)} \\ &= (-\mu\pi)^{-\frac{n}{2}} e^{\mu t}, \end{aligned}$$

where  $t = \sum x_i^2$  and  $\mu = -1/(2\sigma^2) \in (-\infty, 0)$ . Since the sample distribution belongs to the exponential family and there exists an open set in the natural parameter space,  $T = \sum X_i^2$  is the complete sufficient statistics, and  $T/\sigma^2 \sim \chi_n^2$ . Therefore, we can come up with the UMVUE of  $\sigma$  and  $\sigma^4$  based on  $T$ .

(a) Let  $T_1 = T/\sigma^2$ , then we have

$$\begin{aligned}\mathbb{E}(\sqrt{T_1}) &= \int_0^\infty \sqrt{t_1} \frac{t_1^{\frac{n}{2}-1} e^{-t_1/2}}{\Gamma(\frac{n}{2}) 2^{\frac{n}{2}}} dt_1 \\ &= \frac{\sqrt{2} \Gamma(\frac{n+1}{2})}{\Gamma(\frac{n}{2})}.\end{aligned}$$

Hence,

$$\mathbb{E}\left(\frac{\Gamma(\frac{n}{2})\sqrt{T}}{\sqrt{2}\Gamma(\frac{n+1}{2})}\right) = \mathbb{E}(g_1(T)) = \sigma.$$

Since  $g_1(T)$  is an estimator based only on  $T$ , and is an unbiased estimator of  $\sigma$ , we know that  $g_1(T)$  is the UMVUE of  $\sigma$ .

(b) Since

$$\begin{aligned}\mathbb{E}(T_1^2) &= \int_0^\infty t_1^2 \frac{t_1^{\frac{n}{2}-1} e^{-t_1/2}}{\Gamma(\frac{n}{2}) 2^{\frac{n}{2}}} dt_1 \\ &= \frac{4\Gamma(\frac{n}{2} + 2)}{\Gamma(\frac{n}{2})} = n(n+2),\end{aligned}$$

we have

$$\mathbb{E}\left(\frac{T^2}{n(n+2)}\right) = \mathbb{E}(g_2(T)) = \sigma^4.$$

Again,  $g_2(T)$  is an estimator only based on  $T$ , and is an unbiased estimator of  $\sigma^4$ , thus, is the UMVUE of  $\sigma^4$ .

### PROBLEM 3.

Suppose  $X_1, \dots, X_n \stackrel{iid}{\sim} \text{Geom}(\theta)$ , where the pmf of  $\text{Geom}(\theta)$  is

$$P(X = i) = \theta(1 - \theta)^{i-1}, \quad i = 1, 2, \dots, \quad 0 < \theta < 1. \quad (1)$$

Geometric distribution can be interpreted as number of Bernoulli trials ( $B(\theta)$ ) needed to get one success.

(a) Show that  $T = \sum_{i=1}^n X_i$  is a sufficient statistics for  $\theta$ , and has pmf

$$P_\theta(T = t) = \binom{t-1}{n-1} \theta^n (1 - \theta)^{t-n}, \quad t = n, n+1, n+2, \dots \quad (2)$$

(b) Compute  $\mathbb{E}_\theta(T)$  and use it to find the UMVUE of  $\theta^{-1}$ . (Hint:  $\sum_{i=0}^\infty z^i = \frac{1}{1-z}$  for  $|z| < 1$ .)

(c) Show that  $\psi(X_1) = I(X_1 = 1)$  is an unbiased estimator of  $\theta$ , use this fact to find the UMVUE of  $\theta$ .

### SOLUTION.

(a) The joint pdf of the sample is

$$f(X|\theta) = \prod_{i=1}^n \theta(1-\theta)^{x_i-1} = \left(\frac{\theta}{1-\theta}\right)^n (1-\theta)^T = \left(\frac{1-e^\mu}{e^\mu}\right)^n e^{\mu T},$$

where  $\mu = \log(1-\theta)$  and  $\mu \in (-\infty, 0)$ . Hence, the sample distribution belongs to the exponential family, and  $T$  is a sufficient. Furthermore, since the natural parameter space  $(-\infty, 0)$  contains an open set,  $T$  is also complete.

The probability of  $T$  equals to  $t$  can be interpreted as the number of Bernoulli trials needed to get  $n$  success, which means the  $t_{th}$  trial succeed and there had  $n-1$  success in the previous  $t-1$  Bernoulli trials. Therefore,

$$P_\theta(T=t) = \binom{t-1}{n-1} \theta^n (1-\theta)^{t-n}, t = n, n+1, n+2, \dots$$

(b)

$$\begin{aligned} \mathbb{E}(T) &= \sum_{t=n}^{\infty} t \binom{t-1}{n-1} \theta^n (1-\theta)^{t-n} \\ &= \sum_{t=n}^{\infty} (t-n) \binom{t-1}{n-1} \theta^n (1-\theta)^{t-n} + n \sum_{t=n}^{\infty} \binom{t-1}{n-1} \theta^n (1-\theta)^{t-n} \\ &= \sum_{t=n+1}^{\infty} \binom{t-1}{n-1} \theta^n (1-\theta)^{t-n} + n \\ &= n + n \frac{1-\theta}{\theta} \sum_{t=n+1}^{\infty} \binom{t-1}{n} \theta^{n+1} (1-\theta)^{t-n-1} \\ &= \frac{n}{\theta}. \end{aligned}$$

Let  $g_1(T) = T/n$ , then we have  $\mathbb{E}(g_1(T)) = \theta^{-1}$ . And since  $T$  is complete sufficient statistics,  $g_1(T)$  is the UMVUE of  $\theta^{-1}$ .

(c) Since

$$\mathbb{E}(\psi(X_1)) = P(X_1 = 1) = \theta,$$

$\psi$  is an unbiased estimator of  $\theta$ . Let  $g_2(T) = \mathbb{E}(\psi(X_1)|T)$ , then we have  $g_2(T)$  is an unbiased estimator of  $\theta$ , too. And,

$$\begin{aligned} g_2(t) &= \mathbb{E}(\psi(X_1)|T=t) \\ &= \frac{P(x_1=1, \sum_{i=2}^n X_i = t-1)}{P(\sum_{i=1}^n X_i = t)} \\ &= \frac{\theta \cdot \binom{t-2}{n-2} \theta^{n-1} (1-\theta)^{t-n}}{\binom{t-1}{n-1} \theta^n (1-\theta)^{t-n}} \\ &= \frac{n-1}{t-1}, \end{aligned}$$

where  $t = n, n+1, \dots$ . Since  $g_2(T)$  is an unbiased estimator only based on  $T$ , a complete sufficient statistics, we can conclude that  $g_2(T)$  is the UMVUE of  $\theta$ .

PROBLEM 4.

Suppose  $X_1, \dots, X_n \stackrel{iid}{\sim} f_a(x)$  where

$$f_a(x) = e^{-(x-a)} \mathbb{I}_{(a, \infty)}(x), \quad -\infty < a < \infty. \quad (3)$$

Find the UMVUE of  $a$ .

SOLUTION.

The joint pdf of the sample is

$$\begin{aligned} f(X|a) &= \prod_{i=1}^n f_a(x_i) \mathbb{I}_{(a, \infty)}(x) \\ &= e^{na} \mathbb{I}_{(a, \infty)}(x_{(1)}) \cdot e^{-\sum x_i}. \end{aligned}$$

By the factorization theorem, we can know that  $T = X_{(1)}$  is the sufficient statistics. Then, let's prove that  $T$  is also complete.

It's easy to know that the pdf of  $T$  is

$$f(T=t) = n f_a(t) (1 - F_a(t))^{n-1} = n e^{-n(x-a)} \mathbb{I}_{(a, \infty)}(t).$$

Suppose  $\phi(T)$  is any real value function satisfying  $\mathbb{E}(\phi(T)) = 0$ , then we have

$$\int_a^\infty \phi(t) n e^{-n(t-a)} dt = 0. \quad (4)$$

Take derivative with respect to  $a$  on both sides of (4), then we have

$$0 = n \int_a^\infty \phi(t) n e^{-(t-a)} - \phi(a) = -\phi(a), \quad \forall a \in \mathbb{R}. \quad (5)$$

which means  $T$  is also complete.

Since

$$\begin{aligned} \mathbb{E}(T) &= \int_a^\infty n t e^{-n(t-a)} dt \\ &= a + \frac{1}{n}, \end{aligned}$$

$g(T) = T - \frac{1}{n}$  is an unbiased estimator of  $a$ , and based only on  $T$ . Therefore,  $X_{(1)} - \frac{1}{n}$  is the UMVUE of  $a$ .
